

Artificial Intelligence (AI) is the simulation of human intelligence in machines. These machines are designed to think, learn, and solve problems like humans.

There are different types of AI:

1. Narrow AI – Designed for specific tasks like voice assistants.
2. General AI – A system that can perform any intellectual task like a human.
3. Super AI – Hypothetical AI that surpasses human intelligence.

Machine Learning is a subset of AI that allows systems to learn from data without being explicitly programmed.

Deep Learning is a subset of Machine Learning that uses neural networks with many layers to analyze complex patterns.

Applications of AI include:

- Healthcare (diagnosis, treatment recommendations)
- Finance (fraud detection)
- Transportation (self-driving cars)
- Customer support (chatbots)

AI systems rely heavily on data. The quality of data determines the performance of AI models.

Ethical concerns in AI include bias, privacy, and job displacement.
